THE HUMAN BATTERY™ PROJECT

DIETARY GUIDELINES

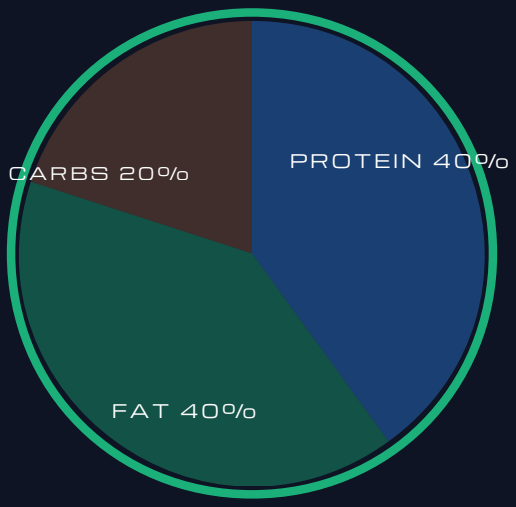

ALL TIERS

Food is the load. It arrives after light has set the clock. Not before.

01

How we eat

Protein first. Fat for fuel. Carbohydrates last, and small. Nothing from a package with more than one ingredient. No snacking. And a window, so the body gets hours every day with nothing to process.

PROTEIN AND FAT ARE MOST OF THE PLATE

1

THE PRINCIPLES

Seven rules that do most of the work

01 **Light before food**

WHAT TO DO You do not eat until you have been outside.

WHY Morning light sets the clock. Food arrives after. Every tier, every day, no exceptions.

02 **Protein at every meal**

WHAT TO DO Build the plate around it. Sardines, eggs, beef, salmon, lamb, liver. About 40 percent of what you eat.

WHY The target is 1.6 to 2.2 grams per kilogram depending on your tier, and most people are well under it when they start.

03 **Fat is the fuel**

WHAT TO DO Extra virgin olive oil, grass-fed butter, tallow, ghee, avocado, the fat in the fish. About 40 percent of what you eat.

WHY Not seed oils. Not margarine. Not anything that says vegetable oil.

04 **Carbohydrates are the smallest part**

WHAT TO DO Vegetables, and for the lower tiers a fist of white rice or sweet potato. About 20 percent of what you eat.

WHY Vegetables are on the plate for what they carry, not for bulk. The fuel comes from fat and protein.

05 **No snacks**

WHAT TO DO Two or three meals inside your window. Nothing between them.

WHY Every snack restarts the insulin cycle and stops the body from ever getting to the work it does when it is not digesting. This one rule does more than any other.

06 **The window closes early**

WHAT TO DO Your tier sets the hours. The last meal ends at least three hours before bed.

WHY Late eating runs the clock backward.

07 **Water with minerals, not with food**

WHAT TO DO Three liters a day with unrefined mineral sea salt in every bottle. Most of it between meals.

WHY The morning glass, with lemon, before anything else.

02

Every day

Once your tier reaches it, these are in every day. They are the foundation the rest is built on.

DHA, EVERY DAY

THE MOST IMPORTANT FOOD IN THE PROGRAM

2

THE DAILY LIST

Ten foods, every day

01 **Sardines**

WHAT The most important food in the program. DHA, calcium, selenium, and almost no mercury.

HOW MUCH A tin a day. In olive oil, wild-caught, skin and bones on.

02 **Pastured eggs**

WHAT Choline, DHA, complete protein.

HOW MUCH Three or four, cooked in butter.

03 **Leafy greens**

WHAT Kale, chard, arugula, romaine, spinach.

HOW MUCH A full bowl. Raw with olive oil or wilted in butter.

04 **Fermented vegetable**

WHAT Sauerkraut, kimchi.

HOW MUCH A forkful with a meal. Refrigerated, unpasteurized, nothing added.

05 **Extra virgin olive oil**

WHAT The fat that goes on everything.

HOW MUCH Cold-pressed, dark bottle, single origin.

06 **Grass-fed butter**

WHAT For cooking.

HOW MUCH Any grass-fed butter is fine.

07 **unrefined mineral sea salt**

WHAT Minerals, not just sodium.

HOW MUCH On food and in every bottle of water.

08 **Wild salmon**

WHAT Sockeye or coho.

HOW MUCH Four times a week minimum. Frozen wild beats fresh farmed.

09 **Cruciferous vegetables**

WHAT Broccoli, cauliflower, Brussels sprouts, cabbage.

HOW MUCH Two cups. Roasted in tallow or steamed with butter.

10 **Avocado**

WHAT Potassium and fat.

HOW MUCH Half to one a day.

On vitamin D. Vitamin D comes from sunlight first and from cold-water fish second (sardines, herring, mackerel, salmon). If a winter blood test shows the level has fallen and sun is not available, D3 may be needed to bring it back up. That is the last step, not the first.

Every week

Beef liver once. Bone broth twice. Grass-fed beef three times. Lamb once.

THE FULL LIST

Approved foods

Protein

Sardines | Wild salmon | Mackerel | Anchovies | Oysters | Grass-fed beef | Lamb | Bison | Pastured chicken thigh | Pastured eggs | Beef liver | Bone broth | Wild game

Vegetables

All leafy greens | Broccoli | Cauliflower | Brussels sprouts | Cabbage | Bok choy | Asparagus | Celery | Cucumber | Zucchini | Green beans | Artichoke | Mushrooms | Onion | Shallot | Garlic | Leeks | Radish | Beets | Carrots | Sauerkraut | Kimchi | Fermented pickles

Fats

Extra virgin olive oil | Grass-fed butter | Ghee | Tallow | Avocado | Avocado oil for high heat | Coconut oil | Olives | Macadamia nuts | Walnuts

Fruit

Blueberries | Blackberries | Raspberries | Lemon | Lime | Avocado | Seasonal fruit, small, with a meal

Starch, Intermediate and Beginner only

White rice | Sweet potato | Squash

Dairy, limited

Grass-fed butter | Ghee | Aged hard cheese (not Pro)

Seasoning

unrefined mineral sea salt | Black pepper | Fresh herbs | Parsley | Thyme | Rosemary | Bay | Basil | Mint | Dill | Chives | Ginger | Turmeric | Cinnamon | Apple cider vinegar | Mustard, no sugar | Coconut aminos

Drinks

Mineral water | Black coffee, before noon | Green tea | Herbal tea | Bone broth | Spring Dragon tea, afternoon

03

What is out

Not forever. Ninety days. Long enough to find out what your body does without them.

GLUTEN SEED OILS SUGAR ALCOHOL PACKAGED

OUT FOR NINETY DAYS

3

OUT

What is out, and why

01 **Gluten**

WHAT Wheat, barley, rye, and everything made from them. Bread, pasta, cereal, crackers, most sauces.

WHO Every tier. Beginner from week 9.

02 **Seed oils**

WHAT Canola, soybean, corn, sunflower, safflower, cottonseed, grapeseed, rice bran. Read every label.

WHO Every tier.

03 **Added sugar**

WHAT In every form and under every name.

WHO Every tier.

04 **Alcohol**

WHAT All of it.

WHO Ninety days, every tier.

05 **Ultra-processed food**

WHAT If it has more than one ingredient and came in a package.

WHO Every tier.

06 **Nightshades**

WHAT Tomato, potato, pepper, eggplant, goji, paprika, cayenne.

WHO Out for Pro and Advanced. In for Intermediate and Beginner.

07 **Grains and legumes**

WHAT All grains including rice, and all beans, lentils, peanuts, soy.

WHO Out for Pro and Advanced. Intermediate and Beginner keep white rice and sweet potato.

08 **Most dairy**

WHAT Milk, cream, yogurt, soft cheese, ice cream.

WHO Every tier. Butter, ghee and aged hard cheese stay in.

BY TIER

Your window and your exclusions

Same principles for everyone. The hours and the exclusions change with the tier.

PRO

7am to 1pm. One 24-hour fast weekly. No grains, legumes, nightshades, starch, or dairy except butter and ghee.

ADVANCED

7am to 3pm. No grains, legumes, nightshades. Butter and aged cheese only.

INTERMEDIATE

8am to 5pm. White rice and sweet potato allowed. Nightshades in.

BEGINNER

No window in month one. 9am to 7pm in month two, tightening. Gluten and seed oils out from week 9. Everything else in.

The morning glass, every tier

Before coffee, before food, before anything: 16 to 24 oz of mineral water with a pinch of unrefined mineral sea salt and 1 to 2 oz of pure organic lemon juice. Empty stomach. It is the first thing the body receives after light.

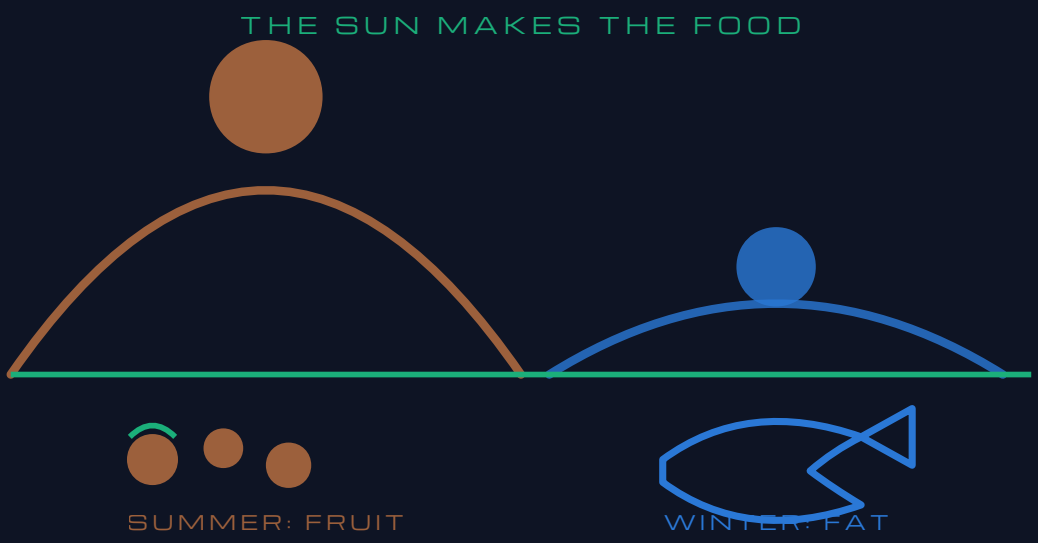

Water for the day

Three liters minimum, every tier. More on days you sweat: sauna, hard training, heat. An unrefined salt with a full trace-mineral profile, not refined sodium chloride in every bottle, because water without minerals passes through and takes minerals with it.

05

Eat what the sun made near you, when it made it

Every food starts as light. Your body knows which season it came from.

5

LOCAL AND SEASONAL

Why the season of your food matters

Every food you have ever eaten started as sunlight. Plants catch light and turn it into sugar and fat. That is photosynthesis. When you eat a plant, you are eating stored sunlight. When you eat an animal, you are eating the sunlight it ate before you.

Your mitochondria are sensors

The mitochondria in your cells do not just burn fuel. They read it. Douglas Wallace, who founded the field of mitochondrial medicine, describes them as environmental sensors. Food arriving in a cell is information about the world outside, not just calories.

Summer food and winter food are not the same

First, what is not true. Food does not carry a message about the month or the place it grew in. The parts of food that give you energy are electrons, and every electron is identical to every other electron. An electron from a summer peach and an electron from a winter parsnip are the same particle. Nothing about it says peach, or July, or Georgia.

Here is what is true. Different foods give your body different fuel. Sugar and fat are handled by different machinery, and switching between them changes how your cells work. That part is settled.

Daylength does something separate. Morning light sets your body clock, and your clock changes how your body handles fuel at different times of year. That part is settled too.

What happens when the two do not line up

Dr. Micah's idea, being tested. Those two settled things meet in your cells. Summer food is mostly available when the days are long, and winter food when they are short, so for most of human history the fuel and the daylength matched. Eat watermelon in January under a light bulb and they do not.

The idea we are testing is about **what the food is made of**: its sugars and starches, its fats, and what your gut bacteria make from it. Those arrive in a body whose clock has already been set by daylength. The idea is that a long run of the two being out of step matters.

What this idea is not. It is not that summer food carries more energy, or more antioxidants, or a better kind of electron. Food does not deliver energy to your mitochondria that way at all. Where your energy comes from is fixed chemistry, and it is the same whatever you ate.

What argues against it. The cleanest animal test looked for the food and daylength effects working together and did not find it: the two worked separately. The result changes from one strain of rat to another. People respond to daylength less consistently than animals do, and some may not respond at all. And there has never been a human trial of in season versus out of season food that measured what it did to metabolism. Not one.

You do not need to believe it to follow the protocol. Eating with the season is a simple rule that costs you nothing if the idea turns out to be wrong.

What to do

Eat what grows near you, in the season you are in. Fruit and berries in summer, and only then. Fat, animals and roots in winter. Local fish. A farmers market tells you what is in season without you having to look it up. Food does not carry a message about where or when it grew. The reason to eat with the season is simpler: different

foods give your body different fuel, and daylength sets how your body handles fuel. Lining those two up is the idea we are testing. It is not a settled fact.

PRO	ADVANCED	INTERMEDIATE	BEGINNER
No fruit for 90 days regardless of season.	No fruit for 90 days regardless of season.	Berries in season only, with a meal.	Fruit in season only, with a meal, never alone.

> This section is part of the Human Battery working model. That plants make food from light, and that what grows changes with the season, is settled. What your mitochondria do with the difference is the frontier, and it is the part we are here to measure.

06

Building a plate

Same shape every meal. Protein and fat first, carbohydrates last. Decide once and stop deciding.

PROTEIN, FAT, THEN CARBS

6

MEAL CONSTRUCTION

How to build a plate

01

The formula

WHAT TO DO Protein and fat are most of every meal, roughly 40 percent each. Carbohydrates are the last 20 percent: vegetables, and for Intermediate and Beginner, one fist of starch at the midday meal. Protein the size of your palm, two palms for Pro and Advanced. Fat over everything. Salt.

02

The first meal

WHAT TO DO Sardines straight from the tin with lemon and olive oil, or eggs in butter. Greens on the side. A forkful of sauerkraut. This is the same meal most days and that is the point. Decision fatigue is how programs die.

03

The main meal

WHAT TO DO A large piece of animal protein cooked in tallow or butter. Two cups of vegetables. Avocado. Olive oil finish. Salt.

04

Eating out

WHAT TO DO Steak or fish, vegetables, no sauce, olive oil and lemon on the side. Ask what oil they cook in. If the answer is vegetable oil, order something grilled dry or choose another place.

05

Prep

WHAT TO DO Cook protein for three days at once. Wash and store greens. Keep tins of sardines everywhere. Boiled eggs in the fridge. The program fails on Tuesday at 6pm with nothing ready, and prep is the only answer to that.

> The cookbook is built only from the approved list. Each recipe logs as a single tap in the portal.

> The Human Battery Project is an educational wellness program, not medical treatment. If you take prescription medication, review any dietary change with your prescriber. If you have a history of disordered eating, do not use an eating window without professional support.

IN SEASON

In season near you now

Seasonal produce is cheaper, travels less and tends to be picked riper. This table is by season rather than by month or by state, because that is the resolution the source has. Your own growing conditions will vary, and the market will tell you more than a table can.

Spring	All leafy greens, Asparagus, Avocado, Blackberries, Broccoli, Cabbage, Carrots, Celery, Garlic, Lemon, Lime, Mushrooms, Onion, Radish
Summer	Avocado, Beets, Blackberries, Blueberries, Carrots, Celery, Cucumber, Garlic, Green beans, Lemon, Lime, Onion, Raspberries, Squash, Zucchini
Fall	All leafy greens, Beets, Broccoli, Brussels sprouts, Cabbage, Carrots, Cauliflower, Celery, Garlic, Green beans, Lemon, Lime, Mushrooms, Onion, Radish, Raspberries, Squash, Sweet potato
Winter	All leafy greens, Avocado, Beets, Brussels sprouts, Cabbage, Carrots, Celery, Leeks, Lemon, Lime, Onion, Squash, Sweet potato

Seasonality unknown for 8 of the foods on the approved list. The guide does not cover them, or they are preserved foods whose season belongs to the harvest rather than to the jar: Bok choy, Artichoke, Shallot, Sauerkraut, Kimchi, Fermented pickles, Seasonal fruit, small, with a meal, White rice. They are left off the table above rather than guessed at.

Source: USDA SNAP-Ed Seasonal Produce Guide, retrieved 2026-09-25. Your portal shows the list for your own postal code and hemisphere, and links to the public directories for finding it locally.
